

Coding Challenge - Customer Profile API

*Congratulations for passing to the next phase of your selection process at **Aeria Games!***

On this phase, we would like you to show us your coding skills. Therefore, please take your time to read through the following project request.

Project: Implement an API which serves profile data to our users

Our product owner just brought to us this project to create a new profile page for our customers. Your responsibility is to design and implement the API which is supposed to serve data to the new profile page.

So please create for us a new restful API in PHP which will be callable for us by running it locally.

Unfortunately, they don't know yet how the page will look like, so no designs / mockups are available. But we trust that your professional expertise will be able to help us deliver an awesome product anyway.

We do know that at least our customers want to view the following information in their profile:

- Username
- Full Name
- Address
- Email

And they would also like to modify the following information:

- Full Name
- Address
- Email

In addition, our internal customer service would like to have the opportunity to delete user profiles. Deletion should be available only to specific users of our staff.

Delivery:

1. Zip your solution and send it to us
2. **Important: Include a README file with a description of how the reviewer can see the working solution. Also add any other comments you might have inside that file. The reviewer will not see the email body, only the code submission.**
3. Please clarify your technology choices in the readme
 - a. We are very interested in the reasons

Notes:

- *Your solution should be made with PHP*
- *Use REST concepts*
- *Just implement it as you would implement any other commercial project*

Have fun!
